Casepoint Investigations

Manage Every Case From Intake to Findings

Configurable Workflow Management for Investigations

State and local IG and accountability offices run investigations on processes they can't change. The work is spread across legacy systems, spreadsheets and paper. Every new mandate or oversight finding means another development request. Every new type of work means another tool and another procurement. Audit histories, custody records and deadlines get assembled by hand for each review.

Casepoint Investigations is a workflow management solution for investigations. It takes an investigation from intake to findings, ready on day one.

Why Choose Casepoint Investigations

Ready for Investigations on Day One?

Begin with workflows built for investigations, then configure them to your office's process.

Change the Process When Requirements Change

Edit workflows, add custom fields without code, and set SLAs in calendar or business days. Process changes no longer wait on a developer.

Keep Every Case in One Record

People, entities, evidence, tasks, documents, techniques and chronology live in one record. A public hotline portal feeds a single intake triage queue.

Defend Every Step

Every edit, upload and view is logged. Approval gates, SLA monitoring and referral tracking are part of the workflow. Evidence chain of custody runs through Casepoint eDiscovery.

One Platform

When evidence sits in one system and the workflow in another, defensibility has to be assembled by hand. Casepoint Investigations runs on the same platform as Casepoint eDiscovery, so evidence processing and chain of custody are handled natively and follow each investigation from intake to findings. It also fits into the Microsoft 365 and Outlook environment your IT team already supports.
