

Casepoint MCP Server

One AI Connection Across Casepoint

Connect your organization's approved AI ecosystem across Casepoint's unified platform — from eDiscovery and legal hold to FOIA workflows.

Ask Questions Across Casepoint Products

Casepoint brings legal, regulatory, investigative, and compliance workflows together on one unified platform.

With the Casepoint MCP Server, users can ask questions that span multiple products — not just a single application — and receive answers based on the information they are authorized to access.

Why Casepoint MCP?

Use the AI Ecosystem You Trust

Connect approved enterprise AI models, custom agents, and internal AI systems without being locked into a single AI experience.

No Custom Integrations

Connect approved AI tools through an open, standardized protocol instead of building and maintaining a separate integration for every AI application.

Maintain Security and Control

The Casepoint MCP Server operates within the trusted security and governance controls already protecting your Casepoint environment.

Every interaction is:

Authenticated

Governed by existing
role-based permissions

Authorized

Auditable

AI agents cannot access information
beyond what the authenticated user is
authorized to access.
