

Casepoint IQ™

The Intelligence Behind Every Government, Legal, and Compliance Workflow

AI that accelerates government, legal, and compliance work while keeping every decision transparent, defensible, and under human control.

One AI Foundation Across the Unified Casepoint Platform

Casepoint IQ™ bring agentic AI, assistive AI, CaseAssist® machine learning and predictive coding, and MCP connectivity together on Casepoint's unified platform. Teams can expand their use of AI without adding separate tools, credentials, or governance models. Casepoint IQ applies existing security, permissions, and governance controls, backed by the platform's FedRAMP® High and DOD Impact Level 5 and 6 authorizations.

What Casepoint IQ Brings Together

	IQ Agents	Purpose-built agents move legal and compliance work from analysis to determination, with transparent reasoning and human approval before the workflow proceeds.
	IQ Assist	Embedded generative AI helps teams find, understand, and classify information through natural-language search, summarization, classification, and workflow-specific assistance.
	CaseAssist®	Active learning and advanced analytics prioritize documents for relevance and identify potential privilege. Precision and recall reporting help teams validate results and support defensibility.
	MCP Server	A secure, standardized connection links approved AI models and agents to the Casepoint platform. Authentication, permissions, and audit logging govern every interaction without the need for custom integrations.

One Platform. One Login.

Access AI across eDiscovery, legal hold, FOIA and public records, and investigations without adding separate systems or logins to manage.

Four Capabilities, Shared Governance

Assistive AI, agentic AI, CaseAssist, and Casepoint MCP Server all run on one foundation — shared context, security, and governance, not four disconnected tools.

Data Stays Within Casepoint

Locally hosted AI models run inside Casepoint's security perimeter, not on third-party model providers' systems, keeping sensitive legal and compliance data under your control.

Expand AI Without Changing Systems

Add agentic workflows alongside existing assistive AI without introducing separate tools, credentials, governance models, or a new platform.

What Sets IQ Agents Apart

Guaranteed Accuracy

A guided workflow validates quality on a sample set before full execution, while multiple AI model process cross-check outputs for accuracy.

Defensible and Transparent

Every AI and human decision is logged with supporting rationale, with recall and precision metrics to help results hold up under scrutiny.

Human Governance Built In

Reviewers retain full authority to approve agent's decision before the workflow proceeds across the full scope.

ROI Visibility

Estimated time and cost are shown before full run, giving teams full visibility before committing resources.
