

CaseAssist® | Powered by Casepoint IQ™

Proven AI You Can Defend in Court

Government, legal, and compliance teams want AI-accelerated review, but every prediction has to hold up under scrutiny. CaseAssist®, the advanced analytics and active learning engine of Casepoint IQ, closes that gap.

AI-accelerated review only works if it holds up under scrutiny. CaseAssist®, the advanced analytics and active learning engine of Casepoint IQ, ranks unreviewed documents by relevance and reports the precision, recall, and stability metrics behind the model, so your team can defend it.

What is CaseAssist?

CaseAssist Active Learning

Tag what you're interested in and CaseAssist Active Learning continuously ranks unreviewed documents by relevance, with full verification, precision, recall, model stability, and F-measure reporting for defensibility. Some teams also pair it with TAR workflows to double-check review calls before they're finalized.

CaseAssist Data Stories

Feed CaseAssist a document or a summary of what you know, and it surfaces related people, places, companies, and products. It builds a data story that gets you to key documents faster.

Predictive Coding

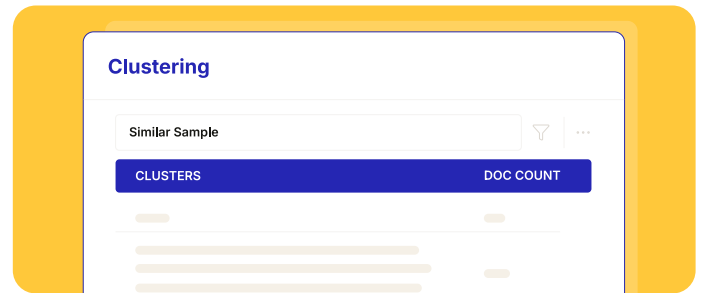

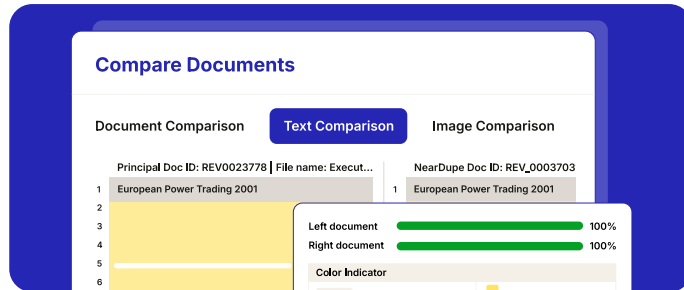

A full iteration-based predictive analytics workflow, with multiple iterations, validation sets, and iteration-based reporting you can stand behind.

Advanced Analytics

Five additional capabilities that sharpen review further:

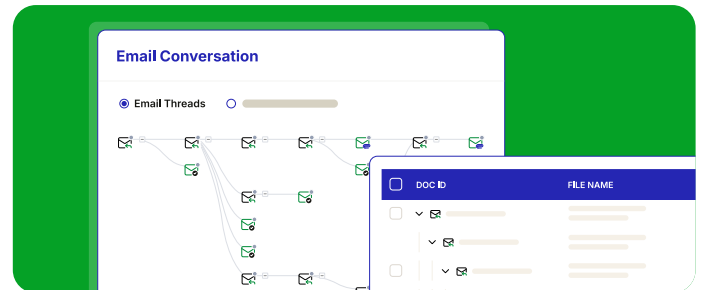

Concept Clustering

Group conceptually similar documents automatically, using hierarchical, semantic, and similarity-based clustering, so related material surfaces without a manual search.

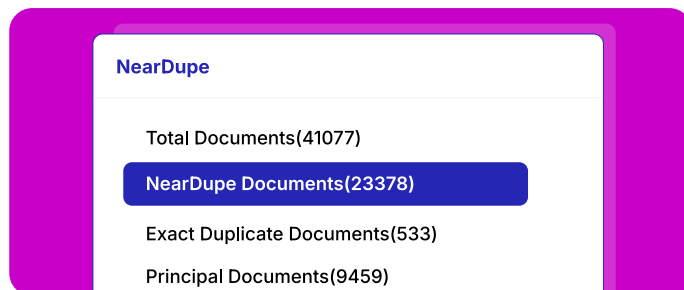

Similarity Search

See how closely documents match, with adjustable text-similarity thresholds from 80-100%, so near-duplicates and variants don't slip past review.

Email Threading

Review full conversations at once, in the order they happened, instead of piecing a thread together message by message.

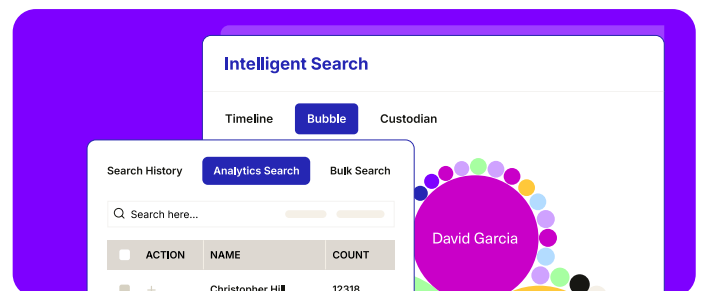

Near Similar Search

Find near-duplicate documents, group results, and cull redundant text, so review time isn't spent on the same content twice.

Intelligent Search

Combine content, field, and analytics-based search in one query for more targeted results than keyword search alone.
